

# Improvements and Fixes - November

Last Modified on 29.01.2026

## Improvements

### Portal

- The Task detail page is now available and shows overall interaction with actions in a bar view. You can see engagement per task and how many times users interacted with each individual action.
- We've updated the "With errors" filter on the Analytics Overview page to work as a toggle, making filtering faster and easier.
- We've also added a Status filter in most Content Analytics pages, so you can narrow down results more quickly (e.g. filter only Announcements in the draft status).
- App Discovery page now includes *Healthcare* as a category to better support industry-specific app discovery and reporting.

### Editor

- We added an improvement to how Validators are stored in the backend when deleted by a customer.
- We added a button in the code selector to help content creators fix small issues quickly and easily.

### Assistant

- We added an improvement so that the Assistant does not close on clicks of the underlying application when a knowledge base article is open and being viewed.

### Other

- We added performance improvements to our selector algorithm to maintain high quality code and performance.
- We added support for inline CSS nonce to our .js snippet for customers who wish to implement it.

## Fixes

### Portal

- We've restricted company moderator permissions, so moderators can no longer delete or edit company users.
- We've fixed an issue on the User Activities page by correcting the date display for migrated users.

### Editor

- We fixed an issue where auto-translation for Tooltips was not functioning as expected.
- We fixed an issue where the Editor would crash with clicks on specific areas of the Editor.

### Assistant

- We fixed an issue where Validators present at the bottom of the users viewport would not render

properly and instead bounce above and below the selected input field.

- We fixed an issue where Input Actions for Tasks were sending events on every keystroke instead of once per total input.
- We fixed an issue where popups in the underlying app were closing when the user clicked on a Userlane element while navigating a Guide.
- We fixed an issue where the search in the Assistant was not returning results.
