

Improvements and Fixes - August 2026

Last Modified on 28.10.2026

Improvements

Portal

- We improved the accuracy of analytics: events are no longer recorded while the Editor is open, so analytics reflect only real use of your application.
- We improved the loading performance of the Portal.

Editor

- We added auto-translation for Validators.

Fixes

Portal

- We fixed an issue where the number of users reached by a survey differed between the survey list and the survey details.
- We fixed an issue where the Notifications page was missing from the Portal.

Editor

- We fixed an issue where steps in a duplicated Guide could point to the wrong element on the page.
- We fixed an issue where the AI prompt for creating a Validator could not be typed in while a pop-up in your application was open.
- We fixed multiple issues with Validators: a single Validator could not be unpublished, field rules described with AI were named after the rule instead of the field, Warning mode failed when the Editor ran in a non-default language, and the unsaved-changes dialog did not work as expected.

Assistant

- We fixed an issue where the Assistant disappeared while users navigated through certain applications.
- We fixed an issue where Guides did not start for some users when opened from the Assistant.
- We fixed an issue where some Guide links did not start the linked Guide.
- We fixed an issue where the Assistant did not appear for new users when the application sent an undefined user attribute.
- We fixed an issue where a Validator rule requiring a value showed a warning on autocomplete fields even when a value was selected.

Other

- We fixed an issue where analytics events from pages with certain special characters in their URL were not recorded.
 - We fixed multiple backend stability and performance issues, including slower loading of content for end users and errors in background processing for Validators and segments.
-
